1 INTRODUCTION

THE SURVEYS

In 2021, 12 surveys were organized. The samples for *Chlamydia trachomatis*, *Neisseiria gonorrhoeae*,*Toxoplasma gondii et Bordetella pertussis* were produced by sciensano. The other samples were provided by QCMD (www.qcmd.org). A panel of samples were sent for each parameter. The panels included samples of different status (negative, infrequently detected, detected or frequently detected).
In 2021 as in 2020, multi-parameter panels were sent for the respiratory pathogens (Influenza and RSV),for the viruses responsible of meningitis (HSV, EV, PEV, VZV) or for the viruses involved in infections in transplat patients (CMV, EBV , BK virus, B19 virus, Adenovirus). In addition, two surveys for the detection of SARS-CoV-2 by PCR were organized in collaboration with QCMD. For these SARS-CoV-2 surveys, the samples were directly sent from QCMD to the participants (table 1).

Table 1. The surveys organized in 2021

Survey	Parameter
2021.1	Toxoplasma gondii (Sciensano)
2021.2	HCV genotyping (QCMD)
2021.3	Chlamydia trachomatis/Neisseria gonorrhoeae (Sciensano)
2021.4	HCV/HBV (QCMD)
2021.5	Respiratory Viruses (influenza, RSV) (QCMD)
2021.6	M. tuberculosis complex (QCMD)
2020.7	High Risk HPV (QCMD)
2020.8	B. pertussis (Sciensano)
2020.9	Meningites viral meningitis (EV,PEV, VZV, HSV) (QCMD)
2020.10	Viruses in transplatation (Adenovirus, BK19, CMV, EBV) (QCMD)
2020.11	Sars-Cov-2 survey 1 (SCV2_21C1B) (QCMD)
2020.12	Sars-Cov-2 survey 2 (SCV2-21C1C) (QCMD)

QCMD garanted the homogeneity and the stability of their samples. For the samples produced by sciensano the homogeneity and the stability were based on the expert's laboratories results.

EVALUATION

QCMD established a scoring system depending of the status of the sample. A sample can be negative (absence of the researched pathogen), frequently detected (detected by more than 95% of the participants), detected (detected by more than 65% of the participants) or infrequently detected (detected by less than 65% of the participants).

Status	Correct answer	Incorrect answer
Frequently detected	0	3
Negative	0	3
Detected	0	2
Infrequently detected	0	1

The infrequently detected samples were not included in the "core" of the panel and must be considerate as educational sample.

Score per laboratory

For *C.trachomatis*, the score ranged from 0 (100% of correct results) to 23 (100% of incorrect results). 60 laboratories (68.2%) obtained a perfect score of 0, 18 (20.4%) obtained a score of 2, 6 (6.8%)a score of 3, 3 (3.4%) a score of 5 and one participant a score of 6.

Discussion of the results for *C. trachomatis*

95.6% of the results were correct. Only sample CTNG2103 seemed more difficult to detect with 20 (22.7%) non-compliant responses. Probably due to a low concentration of target DNA both for C. trachomatis and N. gonorrhoeae. Sample CTNG2105 seemed to pose a problem for users of the Genexpert method with 9 indeterminate results out of 21 participants (42.9%) possibly due to the inability to detect human DNA which serves as internal control.

Neisseria gonorrhoeae

87 laboratories encoded results.

Score per laboratory

The score ranged from 0 (100% of correct results) to 21 (100% of incorrect results).
19 laboratories obtained the ideal score of 0, 44 laboratories obtained the score of 1, 4 laboratories the score of 2, 12 laboratories the score of 3, 7 laboratories the score of 4en one laboratory the score of 10.

Discussion of the results for N. gonorrhoeae

The CTNG2103 sample was very weakly positive and most (64/87 or 73.6%) could not detect it. On the other hand, the other samples did not really pose any problems with 95.7% of correct answers (583/609).

Conclusion.

Since sample CTNG2103 caused problems for both the detection of C. trachomatis and the detection of *N. gonorrhoeae*, it should not be part of the laboratory evaluation. If sample CTNG2103 is removed from the evaluation, the percentage of correct results reaches 98.2% for C. trachomatis and 95.7% for *N. gonorrhoeae*. On the other hand, for the analysis of sample CTNG2105, by the Genxpert method, 9 laboratories out of 21 for *C. trachomatis* (i.e. 43%) and 8 laboratories out of 21 for *N. gonorrhoeae* (i.e. 38%) did not get results.

B. MYCOBACTERIUM TUBERCULOSIS

Color code. Blue=Not determined; green= correct answer; orange; false negative for a detected sample; red= false negative for a frequently detected sample or false positive result.

SCORE PER LABORATORY

The score can range from 0 (100% correct results) to 28 (100% false answers)
27 laboratories (77.1%) obtained the ideal score of 0, 4 (11.4%) obtained the score of 3, one laboratory obtained the score of 6, one laboratory obtained the score of 13, one laboratory the score of 14 and one laboratory the score of 19.

CONCLUSION

3 laboratories performed badly with a score of 13, 14 and 19, respectively.
Two used the Cepheid method and obtained 50% of “not determined” results and one used a conventional PCR method (7 wrong results).

Score per laboratory

For the quantitative results, the scoring system was based on the cumulative Z score.
The score was 0 for a Z score <1; the score was 1 for a Z score between 1 and 2, the score was 2 for a Z score between 2 and 3, the score was 3 for a Z score upper than 3 and for a ND result.
Therefore, out of the 23 laboratories encoding one dataset, 2 obtained the score of 0, 1 obtained the score of 1, 6 obtained the score of 2; two obtained the score of 3, one the score of 4, four the score of 5, two the score of 6, two the score of 7, one the score of 8 and 2 the score of 11.
The laboratory encoding 2 datasets obtained the score of 4 (0+4).

Quantitative Score per laboratory

For the quantitative results, the scoring system was based on the cumulative Z score.
The score was 0 for a Z score <1; the score was 1 for a Z score between 1 and 2, the score was 2 for a Z score between 2 and 3 and for a ND result for a detected sample, the score was 3 for a Z score upper than 3 and for a ND result for a frequently detected sample.
Out of the 27 laboratories encoding one dataset, 2 obtained the perfect score of 0, 5 obtained the score of 1, 7 obtained the score of 2, 2 obtained the score of 3, 3 obtained the score of 4, 5 obtained the score of 5, 1 obtained the score of 7, 1 obtained the core of 10 and 1 obtained the score of 11. The laboratory encoding two datasets obtained the score of 7 (6+1).

Score per laboratory

6 laboratories obtained the ideal score of 0. Three laboratories obtained the score of 1. Three laboratories obtained the score of 2. Five laboratories obtained the score of 3 (absence of results).

Conclusion.

For the genotyping, the subtyping is especially important for 1a and 1b subtypes because it is linked to a potential treatment. It is less critical for the others types. The evaluation took this point into account.

D. SARS-COV-2

In 2021, two surveys were organized in collaboration with QCMD for the dectection of SARS-CoV-2 virus using molecular methods. .

Survey 1.

1. THE SAMPLES

The samples were produced and shipped by QCMD (Scotland). The homogeneity and the stability of the samples were guaranteed by QCMD.

188 datasets and 5 samples for 940 results. 900 results (95.7%) were correct. 38 results were false negative results and 2 results were not determined.

4. SCORE PER LABORATORY

The score ranged from 0 to 16 per dataset.
Out of the 55 laboratories encoding one dataset, 46 (83.6%) obtained a perfect score of 0. Five (9%) obtained the score of 2, 2 obtained the score of 5, one the score of 8 and one the score of 11.
Out of the 28 laboratories encoding two datasets, 25 (89,3%) obtained the ideal score of 0, 2 laboratories obtained a score of 2 and 1 laboratory obtained the score of 3.
Out of the 18 laboratories encoding 3 datasets, 11 (61.1%) obtained the score of 0, 2 obtained a score of 2, 1 obtained a score of 4 (2+2+0), one obtained a score of 5 (5+0+0), one obtained a score of 8 (8+0+0), one a score of 11 and one a score of 13 (8+5+0).

For the 3 laboratories encoding 4 datasets, 2 obtained the score of 0 and 1 the score of 2.
The laboratory encoding 5 datasets obtained the score of 0 and the laboratory encoding 6 datasets obtained the score of 2.
In summary, out of the 106 laboratories, 85 (80.2%) obtained the ideal score of 0. 11 obtained the score of 2, 1 obtained the score of 3, 1 the score of 4, 3 obtained the score of 5, 2 the score of 8, 2 the score of 11 and 1 the score of 13.

The participants

114 laboratories encoded results. 57 laboratories encoded one dataset, 37 laboratories encoded two datasets, 17 laboratories encoded 3 datasets, 1 laboratory encoded 4 datasets, 2 laboratories encoded 5 datasets. In total; 196 datasets were encoded.

Score per laboratory

The score per dataset can range from 0 (100% good results) to 14 (100% of wrong results). For the participants encoded more than one dataset, the scores of the datasets were added.

Out of the 57 laboratories encoded one dataset, 53 obtained the ideal score of 0 and 4 obtained the score of 2.

Out of 37 laboratories encoded 2 datasets, 31 obtained the score of 0, 3 obtained the score of 2, 2 obtained the score of 3 and one obtained the core of 4.

Out of the 17 laboratories encoding 3 datasets, 14 obtained the ideal score of 0, One obtained the score of 5 (0+0+5), one obtained the score of 8 (0+0+8) and one obtained the score of 11 (0+0+11).

The laboratory encoding 4 datasets obtained the score of 0.

Out of the 2 laboratories encoding 5 datasets; one obtained the score of 0 and one obtained the score of 3 (0+0+0+0+3).

Out of the 114 laboratories, 100 (87.7%) obtained the ideal score of 0.

E. RESPIRATORY VIRUSES

1.1.1.1.1 The samples

The multi-parameters panels allow to detect different pathogens in a same sample. In the RESPI21S panel (catalogue number QAV164188_1) the pathogens are: Influenza virus and Respiratory Syncytial virus.

RESPI101S-10	Respiratory Syncytial Virus (type B)	24 RSV

For all the participants, their workflow included the detection of both influenza and respiratory syncytial viruses.
Therefore, out of the 240 encoded results, 232 (96.7%) were correct. 5 false negative results and 3 incomplete results were encoded.

Score per laboratory

The score can range from 0 (100% correct results) to 28 (100% of false results). 18 (75%) laboratories obtained the ideal score of 0, four laboratories obtained the score of 2, 1 laboratory the score of 3 and one laboratory the score of 14.

F. VIRUSES IN THE CONTEXT OF TRANSPLANTATION

The panel TRANS21S (catalogue number QAM174198_1) from QCMD was used in this survey. This multi-parameters panel allows the detection of several viruses involved in transplantation problems such as: adenovirus, Epstein Barr Virus (EBV), Cytomegalovirus (CMV), B19 virus, human Herpes virus 6 or BK virus.

The Participants

17 laboratories encoded results, 16 encoded one dataset and one encoded two datasets giving 18 datasets. Not all the participants analysed all the parameters. If the used method is unable to detect the pathogens present, the result was considered as “not tested”.

Score per participant

Out of the 31 laboratories encoding one dataset, 20 (64.5%) obtained the ideal score of 0, 3 obtained the score of 2, 5 obtained the score of 3, one obtained the score of 6, one the score of 8 and 1 the score of 13.
The two laboratories encoding 2 datasets obtained the score of 0 and 2 (0+2), respectively.
The laboratory encoding 3 datasets obtained the score of 7 (0+0+7).

Comment.

For the syndromic panels, QCMD don't give us the used method or kit. Therefore, we can't evaluate the method.

The results indicated that the percentage of correct results ranged from 87.1% (N. gonorrhoeae) to 100% (T. gondii and B. pertussis). The overall percentage of correct answers was 96.8% (97.1% in 2020). The comparison of the surveys is presented for information only. Indeed, the composition of the various panels may differ from one survey to another.
